Heterozygous Positive Manual Guide

Having 1 Factor V Leiden gene (heterozygous type) slightly increases the chance of developing a blood clot. Having 2 Factor V Leiden genes (homozygous type) makes the risk much greater. Other risks Having Factor V Leiden does not appear to increase the chances of developing a heart attack or stroke.

Factor V Leiden - Blood Clots

homozygous Rh-positive, meaning that his two genes, although different from each other, both code for Rh-positive. The most probable genotype in any population group

optional; most blood bankers prefer to perform a DAT only if the screen is positive. The autocontrol and DAT provide useful information in determining whether patient's antibody is directed against his or her red cells or transfused cells. Antibody identification. Antibody identification is performed after the positive results of antibody screening.

chromosome. This deletion removes one of the alpha- globin genes from the alpha-globin gene cluster.

Thalassemia Minor alpha & beta trait, how common is this?

There is also compound heterozygous, which is when you have one mutant allele on both the 677 and 1298 base position.

Summary: In genetics, hetero- and homo- refers to the two alleles (letters) on the gene. A heterozygous mutation means one copy of the mutation, homozygous means two copies.

The 3.7 kb deletion is a deletion of one of the two alpha genes in a cluster. Homozygous means that this same deletion occurs on both clusters. So each cluster has one alpha 3.7 gene and one normal gene. This means you can pass on only one of these pairs, so your child can receive only one alpha deletion from you.
